

Pharo development examples and exercises

This repository¹ contains small Pharo² programs to be used as development examples or use-cases during programming courses.

The final, complete code is available as a FileTree³ snapshot in the repository subdirectory. Do not be surprised if code excerpts in the tutorial do not exactly match the snapshot: for important methods, we explain successive intermediate implementation steps. We also slightly shorten package names for concision.

Currently, there is only the following example program:

- A simple simulation of a computer network, showing how packets are delivered (package `Kata-NetworkSimulator`).
